

Order Service

Description

This project is a simple order management service built with FastAPI.

Technologies

- Python 3
 - FastAPI
 - SQLAlchemy
 - SQLite
 - Alembic
 - Pytest
 - Docker
-

Project Structure

```
order-service/
├── app/
│   ├── routes/
│   ├── crud.py
│   ├── database.py
│   ├── models.py
│   ├── schemas.py
│   └── main.py
├── tests/
├── alembic/
├── Dockerfile
├── docker-compose.yml
├── requirements.txt
└── README.md
```

Run the project

Local

Install dependencies:

```
pip install -r requirements.txt
```

Start the server:

```
uvicorn app.main:app --reload
```

Open Swagger:

```
http://127.0.0.1:8000/docs
```

Docker

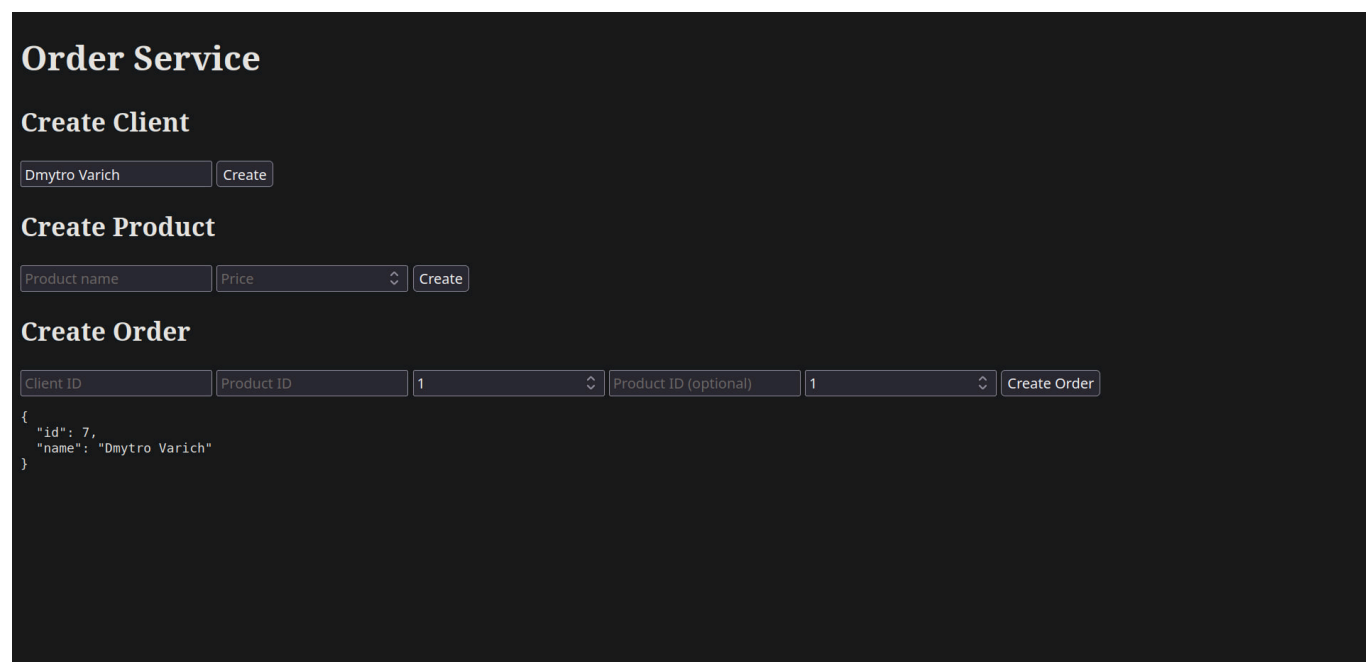

Build and run:

```
docker-compose up --build
```

Run tests

```
pytest
```

Screenshots

Why this approach

I used FastAPI because it is simple, fast, and provides automatic API documentation.

SQLAlchemy was used as the ORM to work with the database in a clean and structured way.

SQLite was chosen because it is lightweight and fully satisfies the requirements of this task.

The project is divided into separate modules (models, schemas, CRUD, and routes) to keep the code organized and easy to maintain.
