Aim of this test task: to assess your skills in analytical thinking and providing informative data insights in English.

Task: Perform an exploratory data analysis (EDA) to uncover insights and summarize your findings.

Deliverables:

- A concise report with your EDA process, visualizations, and key insights.
- SQL queries and Python code used in your analysis.

Before you start

Keep the goal in mind

The goal of the exercise is to find out whether there is potential for further analysis of the problem. To the people involved in this problem, this analysis is only a small puzzle piece. We are not going to roll out a new model or make major changes to our processes based on your analysis alone. This means that you only need to touch on the particularities of the data and make them visible to other people.

Similarly, the real goal of the exercise is to get an interview. **Making us want to meet you in person is more important than using the right jargon or coming up with the right numbers.**

There's no wrong answer

We're not looking for the right answers. We're more interested in seeing the approach you take and your ability to make it easy to follow.

Don't spend too much time

The exercise has the potential to be very time-consuming. We don't want to waste your time. We'd recommend you timebox yourself to 3 hours with a view of having a rough document you could send us at the end of this time period.
